If you've ever worked with various programming languages, you must have encountered the need to share source code among developers and testers. Being exposed to different programming languages is a challenge to work with, and the process of modifying source code tends to become more tedious when dealing with a large number of files. Unfortunately, doing so without automatic text comparison technologies can be far from a pleasurable endeavor. In fact, programming languages have an alphabetical order, which makes it virtually impossible to transfer a large number of files from one language to another without a proper comparison. That is the case with JCppEdit. After installing JCppEdit on your system, you can transfer your files automatically, or even skip that step altogether and simply open your source code right from the IDE. JCppEdit does not only support Windows and Linux platforms, but also a wide range of other operating systems, including Mac OS and Android. The last major advantage of this program is the convenient navigation and user interface. JCppEdit does not focus on a huge number of features; rather, it provides a simple design that is perfect for beginners who do not need to be overwhelmed with different options. JCppEdit includes an integrated build log component that keeps track of the modifications applied to each file, making the entire experience even more convenient. Additionally, you can set it to monitor your project and keep you informed on what is happening to your files. The build log is a powerful component, which shows you the list of changes that happened to each and every file, and allows you to even sort the list by name, as well as file type.
