Simvastatin prevents procollagen-II production and expression in hepatic stellate cells. Liver fibrosis is initiated by the accumulation of extracellular matrix. The lipid lowering agent simvastatin has been shown to prevent liver fibrosis in a rodent model. We studied simvastatin effects on procollagen-II expression in hepatic stellate cells (HSCs) in vitro. HSCs were isolated from Fischer 344 rat liver and cultured in semi-defined medium. After 48 h, cells were incubated with simvastatin (10, 25, and 100 microM) or vehicle control. The effect of simvastatin on cell growth was studied by a 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyl tetrazolium bromide (MTT) assay. Collagen-I, -II, and -III mRNA and protein expression levels were studied by quantitative real-time reverse transcriptase polymerase chain reaction and Western blotting, respectively. Compared with control (DMSO), simvastatin decreased collagen-I, -II, and -III mRNA and protein expression levels (for simvastatin 10 microM: -53%, -58%, and -49%; for simvastatin 25 microM: -75%, -83%, and -80%; for simvastatin 100 microM: -92%, -93%, and -80%, respectively). Simvastatin did not affect HSC proliferation. Our data suggest that the anti-fibrotic effect of simvastatin in vivo is not attributable to cell proliferation effects. Rather, simvastatin inhibits hepatic stellate cell production of procollagen-II.
