The most common way for home users to connect to the Internet is through a modem connected to a PC using an Ethernet cable. However, there are many situations where you may not have an Ethernet cable available. With RJ11 CAT5 (Cable Telecommunications) ethernet you can create a local area network over phone lines without the need for a cable. When a modem is connected to a telephone line there is another device connecting to the modem called a router. It is the job of the modem and router to determine the address or IP address of the PC that will be connected to the network and to translate and act as gateway between the PC and the network. A router uses two methods to do this. It can use the FFF (Friendly Firmware Flashing Fix) system which identifies the modem and the router as one unit, or it can identify each unit independently. It can use a Fixed IP address or a dynamic address (dynamic DHCP IP address). Fixed IP addresses are much easier to set up, but using DHCP requires no effort on your part. This brings us to the four ways your modem and the router can be configured to use a fixed IP address. How to Setup Router to DHCP Step 1: Disconnect the Ethernet cable from the modem to your PC and connect the supplied RJ11 Cable to your modem. Turn on your PC and go to Start | Settings | Control Panel | Network and Internet If this is your first time using a router, then you will see the Settings icon. Step 2: Click on Settings Step 3: Click on Connections Step 4: Select Local Area Connection Step 5: Click on Create a New Connection Step 6: Enter TCP/IP into the Connection Name Step 7: Click on Basic Step 8: Click on IP Address Range Step 9: Enter the static IP address (See screenshot below) In this case we will be using the static IP address 192.168.1.17 Step 10: Select Subnet Mask (See screenshot below) In this case we will be using a Subnet Mask of 255.255.255.0 Step 11: Click on the Defaults button Step 12: Enter the Default Gateway as 192.168.1.1 Step 13: Click on Local Area Settings Step 14: Click on Additional Settings Step 15: Click on DHCP Step 16: Click
