It states that you should create a GameManager class and an IGameManager interface. You create an instance of the GameManager and pass it to the appropriate components in your game. You then just define public methods that expose what the class should do. I find it easier to understand in an object-oriented way. But I don't see a downside to doing this. So, I created a class like so: `class GameManager { private: GameState *state; GameManager *nextGameManager; public: GameManager(GameState *_state) :state(_state) { nextGameManager = this; } ~GameManager() { nextGameManager = this; } void update(); }` Will it cause problems? A: It's OK. Object orientation is all about hiding what happens under the hood. Basically it means using abstraction and encapsulation to make the details of what goes on beneath your model more visible. You don't have to make all your member functions public, nor do you have to make all the member variables public. You can (and should) encapsulate them to a degree. If you look closely, at how they're used in your code, you'll notice that you're exposing them, but in a very controlled way. If you read Game Programming Gems 5 (The "GDI Graphics Gems") you'll learn about many such design decisions. I highly recommend it. During the campaign, President-elect Donald Trump repeatedly promised to bring back

ABSOLUTE SOUL The main goal of Absolute Soul is to fill a missing gap in software. It is the application of the service provider that sends an SMS to the application with a list of the places with which the application can be connected to and the cost of each connection. When the user is connected to a desired place then it is moved on to the next one on the list. With this application you can find any place you need, no matter if it is a hotel, a café, a bar, a shop or your home. Not only this, Absolute Soul also offers location-based services like text messaging, photo sharing and more.

Q: How to get Post JSON into a Rails View I am sending a POST request to a rails application with the following JSON: { "users": [{ "first_name": "test", "last_name": "test", "email": "test@test.com", "password": "test" }, { "first_name": "test", "last_name": "test", "email": "test@test.com", "password": "test" }] } The Rails app makes a POST request with the user credentials into the database. However, the JSON is not passed to the view. The view is shown with the following line: How can I get this working? A: You have to include the users as attributes in your view: Just when I was getting my first peek at what Opera 11 is like, it got a bit unexpected, and will no doubt cause a little thrill: In a planned blog post published on November 10th (by me) and about a week later (in a blog post by Fabio Massimo D'Eras
