Layer Style. The default Photoshop workspace is an image organized by layers. Different layers have different characteristics, such as gradients, patterns, and color overlays. You can combine layers to create all kinds of effects. Use `_layer style_` to specify how a layer will look. In fact, you can specify the style when you create a layer. To add a layer style, select the layer. Then choose Layer→New→Layer Style. Then, in the New Layer Style dialog box, choose one of the presets to use in creating a layer style. **Photos or Draw**. When you open an image for editing in Photoshop, the default setting is for you to be able to do everything — draw as well as edit the image. You can open the Image Options dialog box and then check off both Draw and Edit to lock your images for editing only with a mouse. (You must be in Expert mode, of course.) If you use the keyboard, you can always click Enter to toggle that setting. **Fill**. Although you can add some basic fills to the canvas, you can't fill the entire canvas. But using a fill offers one of the easiest ways to add color to the canvas. Use the Polygonal Lasso tool to select the area you want to fill, and then use the context menu or the Fill dialog box to specify the color. Filling is especially useful for creating a background. You can use a brush to paint an entire background with one color, or you can use a gradient fill for a softer transition from one color to another. **Presets**. As you create and edit photos, Photoshop saves a number of presets so that they are ready to apply. You can quickly return to a preset when you need it. You can see a list of the presets that have been saved in the Preset Manager window (Windows) or the Preset menu (Mac). In addition to choosing a preset, you can access any of the temporary preset states that you've used while editing, such as "overexposed," "sharply overexposed," "highlights," or "underexposed." **Develop**: Use different settings to change the appearance of your image, for example, changing its contrast and brightness. **Adjust**: Use this tool to apply a basic set of photo adjustments to your

Q: Make a toggle class on JS input type=checkbox I'm trying to make a toggle class on checkboxes, but my knowledge of JS is very limited. I have input type="checkbox" and I'm trying to have one of several classes applied to the box if it's checked, and not applied if it's not checked. Here's my code so far: `$('#visibility_form').click(function() { if ($(this).is(":checked")) { $("class for checkbox").addClass("hide-button-on-form-checkbox"); } else { $("class for checkbox").removeClass("hide-button-on-form-checkbox"); } });` A: You would have to add/remove a class to the actual checkbox itself. `$('#visibility_form').click(function() { $(this).toggleClass('checked'); });` Q: Variable initialization inside of a function I want to initialize a constant variable that must be shared by many of the functions in my program. So I just want a way to make sure that all the functions can read and write it at the same time. I know there is no real use for defining a constant variable inside a function, but then how can I make sure that it gets initialized before the functions start? Pseudo code: `int a = 0; void func1() { // do something a = 4; } void func2() { // do something a = 5; } void main() { a = 10; }` A: You can use a static local variable. `static int a = 0; void func1() { // do something a = 4; } void func2() { // do something a = 5; }`

An ancient volcano site in western China has been a tourist attraction since the 1950s, and now it can also be a slice of modern history. Scientists have unearthed a burial site inside the ancient volcanic activity site that researchers believe dates back to the Western Han Dynasty. The burial was found when an excavation was carried out during the construction of a new bus route. Researchers from Zhejiang and Sichuan universities said they were able to confirm the old name of the volcanic site, Gulaishan, as well as its age by analyzing different techniques. Gulaishan is located in the southeastern part of the city of Suining in China's eastern Zhejiang province. It is close to the Huangshan mountain range, which is the second highest mountain range in China. It contains a lot of minerals and radioactive stones. Researchers discovered bones and jewelry buried in the volcanic mud from the site. The geological research team who studied the site was able to find the volcanic layer that was dated back to 520 to 616 AD, which is the Han Dynasty. "The Gulaishan burial site is an important archaeological discovery," study co-author Qu Xuesen said in a statement. "Through excavation, we found artifacts that are part of daily life at the time. In the past, artifacts like these were found in excavation sites and recorded as historical relics. This time, we were able to see those artifacts and their daily lives are closer than we think. This result can tell us how the Han citizens lived." The Han Dynasty was the ruling dynasty of China from 206 BC to 220 AD. It is called the Western Han Dynasty because it lasted till the middle of the 2nd century AD. The bones of the Han subjects were buried with their belongings and were stacked on their chests in order to be buried easily. They have also been found holding bowls, knives, ornaments, and even a pillow. The scientists were able to analyze the strata and the volcanic layer to be able to define when the burial occurred. They found fossil remains of trees embedded in the volcanic sediment. Those fossils were found to be fossil of short-cropped trees that were between 1.5 and 2 meters tall. The scientists were able to find the culture in which the Han people lived through those plants and fossils. The volcanic layer also contained artifacts from the Wei, Jin, and Tang Dynasties. These are other significant periods in Chinese history. Researchers
