and so on. All the time power supply is running and the lights are on. To start with - I've got a new mobo which I've tried out in 4 different motherboards. They all worked perfectly. Also, I've been trying to screw with the motherboard memory and testing other things so the last motherboard I tested out completely changed, including CPU, GPU, CPU interface board and memory. I'm not sure what to do, but this is the latest motherboard I've tested. There's also a problem that sometimes the problem is worse and then it freezes and won't respond to anything and the only way to run again is to start all over again. This often happens to me when I do gaming. Has anyone encountered this problem? If so, how do I fix it? A: That X556 looks pretty old. It's also using a very old version of the ADI chipset that can be rather finicky. So it's going to take someone with a lot of experience with these old chipsets to work out what is wrong. You may be able to get it to work by replacing the entire motherboard with another from a similar era that doesn't have the trouble with the chipset, and be done with it. That said, it looks to me like it's a good candidate for a board swap. To swap out a motherboard you can remove the mobo, and the CPU and GPU cables from the motherboard. Then get some new CPU and GPU cables, and reattach them to the new motherboard. That shouldn't take too long, and you'll be up and running again in a jiffy. I'd suggest that before putting a new motherboard in though that you take a clone backup of your hard drive and restore it to a new drive once the new one is in place. That

way if there are any problems you'll be in good shape to restore your data from the clone. But that's not the same as swapping mobos. So doing that may be a good way to go if you are comfortable with the idea.

```
import { ILayoutService, ILayout, ILayoutExporter, ILayoutState, IConfig, ILayoutHandler, ILayoutable } from '@ephox/bedrock-client';
import { each, omit, throwNever } from '@ephox/katam
```
