While LISP was used in the 1960s and 1970s for teaching, the LISP implementation of Pascal originated in the United Kingdom at the School of Electrical Engineering, University of Birmingham in the 1970s. It was the first implementation designed with integrated development environments, such as a clean room compiler and a high level debugger.

The Byte Magazine magazine called the implementation "the purest form of a functional language anywhere developed in the 20th Century", and encouraged the programmer to learn LISP to use it. In the 1970s, a group at the University of Illinois, Urbana-Champaign was involved in creating a compiler for what eventually became Ultrix, and as such were privy to first-hand experience with many nonstandard features of the language, such as a non-blocking synchronous I/O and machine-level threading. Ultrix Pascal is based on that compiler, and was approved for inclusion in the latest edition of the Unix standard. Unlike most other Pascal implementations, the system in

Berkeley Software Design Incorporated's BCPL/C compiler adds blocks and procedures as optional constructs, and the Pascal compiler in the CHILL Environment comes without full garbage collection. The CHILL environment includes a debugger, object-oriented programming, user interface widgets, and most other major features of the Pascal language, which have been heavily influenced by BCPL/C in common with the Chipmunk environment. In this and other respects, the CHILL environment has the most Pascal-like set of extensions and limitations of any non-commercial Pascal implementation.

Kumpulan Soal Pascal

Leslau and Lucas' MIT Pascal was enhanced with the FORTRAN front end and P-system to produce a port of their FORTRAN system at General Electric (GE) in 1973. This port was called MIT-P, the first version of the P-system which produced a virtual machine, the General Electric (GE) Virtual Machine (GEVM). In 1978, Leslau, Leslau and Lucas (the LLL compiler) was completed for the P-system; it was called Microsoft Pascal and it was designed to run on the Microsoft MS-DOS (Microsoft Disk Operating System). At some point it was known as Pascal: Microsoft External (MS-Pascal). B. Lubbe was employed by Digital, the developer of the VAX

(VAXstation), in Switzerland in 1980/81. He ported C, Pascal, MOSS (a precursor of MODUS) and Java to the VAX. He contributed many Pascal and C compilers to the VAX, including one called Yacc. Among the first Pascal compilers to use the VAX architecture were the DOS Pascal compilers, by 'B' and Terauchi. These were popularly known as Pascal-VAX and Pascal-D86. The port of K&R Pascal 3.0 to the IBM 471 series was completed by K. Curran and B. Cohen in 1986. The compiler, known as K&R (an acronym for Kernighan and Ritchie), was a major improvement over earlier K&R Pascal compilers, due to simplifications of the bytecode that made it run faster. The compiler was also available for the IBM PC DOS, the Intel 8086 family of microprocessors and the IBM CP/CMS family of microprocessors, using Z85 microcode. The K&R compiler was also ported to newer microprocessors (Intel i860, Alpha, PowerPC, z/Architecture), some of which had non-standard instructions which required subroutines and other changes. Later, Dave Cottrell and Robert Gaunt ported the K&R compiler to the x86-based PowerPC microprocessors, resulting in the Pascal Port Authority compiler. 5ec8ef588b
