EASEUS Data Recovery Wizard Professional Edition v5.6.5. Related.Q: Properly adding a new action when using a TaskBuilder I am new to C# but have a fairly good grasp of Java. I am trying to get my head around the TaskBuilder pattern but I am struggling with what is the best way of adding a new action. In Java, I would make the Action block the method and invoke the method within the block. Below I have listed a simplified example of how I would do it in Java. public void process() { action() { doSomething(); doAnotherThing(); } } public void doSomething() { //do something } public void doAnotherThing() { //do another thing } I am having a hard time trying to come up with a good solution in C#. I would ideally like to see an example using a TaskBuilder and not use any other 3rd party libraries. In the code below, I am essentially copying over the method in the Action to the new method and passing in the new method to be invoked. Is this correct or is there a better way? Task task = Task.Run(() => { //do something }); action() { doSomething(); doAnotherThing(); } A: After getting help from @Kamran, I have come up with this as the answer public void process() { action() { doSomething(); doAnotherThing(); } } public void doSomething() { f988f36e3a
