Although the review I gave the previous version of Photoshop (2.9) was great and covered many of these advantages, it was also missing some essential features:

- Full support for the 4K resolution of the iPad Pro

The new multi-page document preview feature would also be perfect with the iPad Pro's display and pencil, especially because it can automatically dock and auto-orient your pages. Any app that can use this technology should be able to take advantage of its potential. If something has improved or gone away in the newest version of Photoshop, I've noticed it – even though I've been using Photoshop since the very beginning. In this case, it's the Quick Selection tool. The new "Meet," "Copy," "Paste," "Paste as Link," "Smart Object," "Paste Into" options are all very useful. If you're familiar with the 'Paste Into' function in the Content Panel, you might be thinking that it's been replaced with 'Select Into' (and you'd be right). There's a 'Paste Into,' that most certainly is designed to past into empty layers, but what's called 'Past Into' is actually the original pasting function that's been added to the status bar. While pasting, you select the destination layer by tapping and holding where you want the selected layer to be pasted. While you're doing this, an arrow appears showing you the origin of the selection. If you continue to tap and hold, you make the selection, creating new layers that represent the selection. The pasting process is more convenient because if you accidentally select the wrong layer, you simply undo the selection and then paste – no new layer is added. Not only that, but you are still able to go back to 'Select Into' mode on any layer. The pasting function is just as easy.
